1 Algoritmi di ordinamento

Algoritmi di ordinamento

1.1 Insertion Sort

```
 \begin{aligned} \mathbf{Data:} & \text{ A array, i indice, j indice} \\ \mathbf{for} & i \leftarrow 2 \text{ to } A.length \text{ do} \\ & | & \text{key} \leftarrow \mathbf{A}[\mathbf{i}]; \\ & \text{j} \leftarrow \mathbf{j} - 1; \\ & \mathbf{while} & j > 0 \text{ & & } A[j] > key \text{ do} \\ & | & \mathbf{A}[\mathbf{j} + 1] \leftarrow \mathbf{A}[\mathbf{j}]; \\ & | & \text{j} \leftarrow \mathbf{j} - 1; \\ & & \mathbf{end} \\ & & \mathbf{A}[\mathbf{j} + 1] \leftarrow \text{key}; \end{aligned}
```

Algorithm 1: InsertionSort

 ${\bf complessit \`a \ temporale}$

complessità spaziale

1.1.1 Merge

scrivere il codice per esercizio

```
\label{eq:definition} \begin{split} \textbf{Data:} & \ A \ \text{array, p indice iniziale, q indice finale} \\ \textbf{if} & \ p < r \ \textbf{then} \\ & \ | \ r \leftarrow \frac{(p+2)}{2}; \\ & \ | \ \text{MergeSort}(A,p,r); \\ & \ | \ \text{MergeSort}(A,r+1,q); \\ & \ | \ \text{Merge}(A,p,r,q); \\ \textbf{end} \end{split}
```

2 code con priorità

2.1 Heap

procedure base

```
 | left(i) { return 2i } | right(i) { return 2i + 1 } | parent(i) { return \lfloor \frac{i}{2} \rfloor} | procedura Heapify
```
